

# Project5 part2

---

## Web server install

In this project, I install the Apache web server manually. Including package: pcre-2.10.42  
httpd-2.4.57 apr-1.7.4 expat-2.5.0 and apr-util-1.6.3

## Deploy and run the map

To deploy our web project, we put all the web pages file under the {your\_folder}/httpd/htdocs.

We used **kapler.gl** to build the whole project. To run the project, go to the {your\_folder}/httpd/bin. And run

```
./apachectl start
```

Then, type your ip address and port on the browser

Here is what the map project look like. You can view all the information related to the well on the map
